

Relay

Reliable | Robust | User-Friendly
Quality Driven Next-Gen Automation

Introduction

A Comprehensive Quality Driven Next Gen Application that offers the user with top notch experience in both *Automated Functional Testing* (UI, API, Mobile & Desktop) as well as *Automated Non-Functional Testing* (Performance & Chaos) and utilized by Adobe Engineering Teams to build Reliable & Robust Products/Solutions.

Functional Automation

Overview

No-Code Automation Framework to test business workflows to ensure expected behavior.

Benefits:

- **Create and organize** filter, clone test cases, suites, and master suites with full flexibility
- **Orchestrate test flows** effortlessly with a few clicks – no code needed
- **Test dynamic elements**, apply validations, add custom JS, and auto-sync feature across linked testcases.
- **Import APIs** using Swagger for quick and structured test setups
- **Automate execution** using Selenium and Playwright frameworks
- **Trigger tests across multiple browsers** for wide coverage
- **Integrate Vault configs, CI/CD pipelines, and JIRA** for streamlined workflows
- **Track test history**, analyze failures, and receive alerts via Slack and email

Only Key Words:

- **Create** and manage use cases with flexible picks
- **Import** APIs through Swagger specifications
- **Orchestrate** tests with no-code clicks
- **Test** dynamic flows, add custom JS, apply validations, sync updates quickly
- **Automate** web apps with Selenium and Playwright
- **Trigger** tests across browser Environments
- **Integrate** with CI/CD, Vault, and JIRA set up
- **Track** history, debug quickly, and get alert checks via email & slack

Performance Lab

Overview

Reuse functional test cases to execute multi-region, scalable, real-world scenarios that evaluates application performance under diverse load conditions.

Benefits

- **Design load configuration** based on user traffic & request volume.
- **Simulate load** from multiple geo-locations
- **Visualize test progress** with live monitoring of KPIs.
- **Identify Runtime bottlenecks** for efficient root cause analysis
- **Analyze performance trends** across historical test runs

Only Key Words

- **Design** Codeless load configs
- **Simulate** multi-region load
- **Visualize** KPIs and graphs
- **Identify** bottlenecks
- **Analyze** performance trends

Mobile Automation

Overview

Conduct seamless mobile application tests on physical (Android, iOS) and cloud-based devices (Sauce Labs).

Benefits

- **Executions** can be done on SauceLab & Physical Device
- **Real time capabilities** of localization, language and scale
- **Run sequential and parallel tests** across IOS and android
- **Automatically capture screenshots** or videos of the tests for analysis.
- **Conduct manual testing** on real browsers to identify UI/UX issues.

Only Key Words

- **Execute** on SauceLab & Physical Device
- **Real -time capabilities** with localization, language, and scale
- **Run tests** sequentially & in parallel on IOS and Android
- **Auto-capture** screenshots/videos for analysis

Desktop Automation

Overview

Unified testing across Windows and macOS with enhanced data-driven test cases that support validation and reporting.

Benefits:

- **Robust , script-free** test creation and maintenance with improved accuracy
- **Compatible** with Windows and MAC OS Applications
- **Smarter** automation with both text and image-based locating strategies
- **Data-driven** tests with validations, reports, recordings, and notifications
- **Parallel** execution runs multiple test suites quickly

Only Key Words

- **Create** script-free tests with robust accuracy
- **Run** on Windows and macOS seamlessly
- **Locate** elements with text and image strategy
- **Drive** data-rich tests with alerts and clarity
- **Execute** in parallel for speed and efficiency

Chaos Simulator

Overview

Introduce failure. Build confidence. Empower your teams with controlled chaos engineering to uncover system weaknesses before your customers do.

Benefits:

- **Test Failure, uncover system weakness** and build resilient apps
- **Simulate real-world infrastructure issues**—
Infra, Latency and ALFI—in a safe, targeted, and repeatable way.
- **Launch fault experiments** without engineering overhead. Seamlessly run GameDays using leading tools like Gremlin, AWS FIS, and Chaos Mesh.
- **From VMs to Kubernetes, from Ethos to Multi-cloud environments**, bring chaos to where your applications live, so you can test anywhere and recover everywhere.

Only Key Words

- **Trigger** failure, expose system fragility
- **Simulate** chaos with safe repetition
- **Launch** fault games with zero complexity
- **Inject** disruptions across Diverse Adobe infra (Ethos to Multi-cloud)
- **Recover** fast with full observability
